

**FOR IMMEDIATE RELEASE**

## **Pinion Software's New SecureMail Powers Secure Information Sharing**

*SecureMail includes powerful Enterprise Rights Management security solutions to protect executive communication, outsourced intellectual property, and comply with regulatory requirements.*

**Austin, TX – April 4, 2005** – Pinion Software, a leader in the emerging market for Enterprise Rights Management, today announced the availability of SecureMail™, a comprehensive enterprise solution for protecting information sent by email. This new product includes features that provide continuous control over the use of sensitive information, facilitates enterprise deployment, and simplifies solution administration and auditing for the IT organization.

Pinion SecureMail provides organizations with complete and continuous control over information that is distributed by email, including the email body and file attachments. SecureMail integrates seamlessly with Microsoft Outlook and Lotus Notes email platforms and enables users to define and control precisely who will receive the information, what they may do with it, and how long they have access.

“Email is the de-facto medium for exchanging information among employees and between companies and their increasingly extended network of business partners,” said Joyce Durst, president and CEO of Pinion Software. “Sharing sensitive information and intellectual property has never been easier, or more dangerous. SecureMail empowers enterprises to share vital information, while at the same time, ensure its continuous protection and integrity.”

Enterprise deployment features include integration with corporate authentication directories and automatic distribution of Pinion Receiver, a free application that allows intended recipients to view and work with files that have been protected with SecureMail. For continuing information control, content owners are able to dynamically update permissions at any time to reflect changing business or project conditions. A web-based, management console provides system administrators with the capability to track and audit secure files, review and modify user permissions, and to manage user accounts.

### **SecureMail 3.0 Features**

- Seamless integration with Microsoft Outlook and Lotus Notes and corporate authentication directories
- Ability to update permissions dynamically
- Improved file security for Autodesk DWG and DWF, Bentley DNG, and Microsoft Project MPP and Visio VSD formats.
- Continuous protection for both email body and file attachments
- Ability to share secure content in its native application format while imposing the content owner's restrictions
- Web-based administrative tool to centrally manage user accounts and track secure documents

**- more -**

SecureMail is the only Enterprise Rights Management solution that works at both the application level and operating system to provide unparalleled security. This allows recipients to work with secure files in their native application, while enforcing the permissions set by the content owner. In addition, with SecureMail it is possible for users of CAD files, DWF viewers, and other technical application files, as well as Microsoft Office documents to perform operations and use real-time data without sacrificing file security.

**About Pinion Software**

Founded in 1998 and privately held, Pinion Software is a leader in the emerging market for Enterprise Rights Management solutions. Pinion Software enables companies to share information with confidence by providing continuous control over how the information may be used. Our flagship system, Pinion Secure Enterprise, protects information both inside and outside the corporate firewall—whether shared by email, corporate intranet, business portals, or document-management systems.
